

On mixed generalized quasi-Einstein manifolds

A. Bhattacharyya and T.De

Abstract. In this paper we extend the notion of generalized quasi-Einstein manifold and name it *mixed generalized quasi-Einstein manifold* $[MG(QE)_n]$. We prove the existence of such manifolds. We also introduce the notion of *generalized quasi umbilical hypersurface of a Riemannian manifold* and show that such a manifold is a mixed generalized quasi Einstein manifold. Finally, we obtain the relation between the manifolds with mixed generalized quasi constant curvature and the mixed generalized quasi-Einstein quasi conformally flat manifolds.

M.S.C. 2000: 53C25.

Key words: mixed generalized quasi-constant curvature, generalized quasi umbilical hypersurface.

§ 1. Introduction

In a recent paper [4] U. C. De and G. C. Ghosh have defined the generalized the quasi-Einstein manifolds. A non-flat Riemannian manifold M is called a *generalized quasi-Einstein manifold* if its Ricci tensor S of type $(0,2)$ is non-zero and satisfies the condition

$$S(X, Y) = ag(X, Y) + bA(X)A(Y) + cB(X)B(Y),$$

where a, b, c are certain non-zero scalars and A, B are two non-zero 1-forms such that

$$g(X, U) = A(X), g(X, V) = B(X), \quad g(U, V) = 0,$$

i.e., U and V are orthogonal vector fields on M .

In the present paper, we extend the notion of generalized quasi-Einstein manifold.

Definition 1. A non-flat Riemannian manifold is called a *mixed generalized quasi-Einstein manifold* if its Ricci tensor S of type $(0,2)$ is non-zero and satisfies the condition

$$(1.1) \quad S(X, Y) = ag(X, Y) + bK(X)K(Y) + cL(X)L(Y) + d[K(X)L(Y) + L(X)K(Y)],$$

where a, b, c, d are non-zero scalars,

$$g(X, U) = K(X) \text{ and } g(X, V) = L(X), \quad g(U, V) = 0,$$

K, L being two non-zero 1-forms, and U, V are unit vector fields corresponding to the 1-forms K and L respectively. We denote this type of manifold by $MG(QE)_n$. If $d = 0$, then the manifold reduces to a $G(QE)_n$.

In this paper we introduce as well another notion which generalizes the notion of a manifold of generalized quasi-constant curvature [4]. A Riemannian manifold is said to be a *manifold of generalized quasi-constant curvature* [4] if the curvature tensor R of type (0,4) satisfies the condition

$$\begin{aligned} R(X, Y, Z, W) = & p[g(Y, Z)g(X, W) - g(X, Z)g(Y, W)] \\ & + q[g(X, W)T(Y)T(Z) - g(X, Z)T(Y)T(W)] \\ & + g(Y, Z)T(X)T(W) - g(Y, W)T(X)T(Z) \\ & + s[g(X, W)D(Y)D(Z) - g(X, Z)D(Y)D(W)] \\ & + g(Y, Z)D(X)D(W) - g(Y, W)D(X)D(Z)], \end{aligned}$$

where p, q, s are scalars, T and D are non-zero 1-forms. Here ρ and $\bar{\rho}$ are unit orthogonal vector fields such that

$$g(X, \rho) = T(X) \text{ and } g(X, \bar{\rho}) = D(X), \quad g(\rho, \bar{\rho}) = 0.$$

Definition 2. A Riemannian manifold is said to be a manifold of mixed generalized quasi-constant curvature if the curvature tensor R of type (0,4) satisfies the condition

$$\begin{aligned} R(X, Y, Z, W) = & p[g(Y, Z)g(X, W) - g(X, Z)g(Y, W)] \\ & + q[g(X, W)A(Y)A(Z) - g(Y, W)A(X)A(Z)] \\ & + g(Y, Z)A(X)A(W) - g(X, Z)A(Y)A(W) \\ & + s[g(X, W)B(Y)B(Z) - g(Y, W)B(X)B(Z)] \\ & + g(Y, Z)B(X)B(W) - g(X, Z)B(Y)B(W) \\ & + t[\{A(Y)B(Z) + B(Y)A(Z)\}g(X, W) \\ & - \{A(X)B(Z) + B(X)A(Z)\}g(Y, W) \\ & + \{A(X)B(W) + B(X)A(W)\}g(Y, Z) \\ & - \{A(Y)B(W) + B(Y)A(W)\}g(X, Z)], \end{aligned} \tag{1.2}$$

where p, q, s, t are scalars. A, B are non-zero 1-forms. Here ρ and $\bar{\rho}$ are orthonormal unit vector fields corresponding to A and B .

$$g(X, \rho) = A(X) \text{ and } g(X, \bar{\rho}) = B(X), \quad g(\rho, \bar{\rho}) = 0.$$

§ 2. Preliminaries

We consider a mixed generalized quasi-Einstein manifold with associated scalars a, b, c and d and associated 1-forms K and L . From (1.1), we get

$$r = na + b + c,$$

where r denotes the scalar curvature of the manifold. Since U and V are orthogonal unit vector fields, therefore $g(U, U) = 1, g(V, V) = 1, g(U, V) = 0$. Putting $X = Y = U$ in (1.1), we obtain $S(U, U) = a + b$. Substituting $X = Y = V$ in (1.1) we further get

$S(V, V) = a + c$. It is known that in an n -dimensional ($n > 2$) Riemannian manifold the covariant quasi conformal curvature tensor is defined as [3]

$$(2.3) \quad \begin{aligned} \tilde{C}(X, Y, Z, W) = & aR(X, Y, Z, W) + b[S(Y, Z)g(X, W) - S(X, Z)g(Y, W) \\ & + g(Y, Z)g(QX, W) - g(X, W)g(QY, W)] \\ & - \frac{r}{n} \left[\frac{a}{n-1} + 2b \right] [g(Y, Z)g(X, W) - g(X, Z)g(Y, W)], \end{aligned}$$

where

$$\begin{aligned} g(\tilde{C}(X, Y)Z, W) &= \tilde{C}(X, Y, Z, W) \\ g(R(X, Y)Z, W) &= R(X, Y, Z, W). \end{aligned}$$

The conharmonic curvature tensor is denoted by $H(X, Y, Z, W)$ and in a $M^n (n > 2)$ it is defined as,

$$(2.4) \quad \begin{aligned} H(X, Y, Z, W) = & R(X, Y, Z, W) - \frac{1}{n-2} [g(X, W)S(Y, Z) - g(X, Z)S(Y, W) \\ & + g(Y, Z)S(X, W) - g(Y, W)S(X, Z)], \end{aligned}$$

where Q be the symmetric endomorphism of the tangent space at each point corresponding to the Ricci-tensor S , and

$$(2.5) \quad g(QX, Y) = S(X, Y), \quad \forall X, Y \in TM.$$

§ 3. Existence theorem of a mixed generalized quasi-Einstein manifold

We can state the following:

Theorem 3.1. *If the Ricci tensor S of a Riemannian manifold satisfies the relation*

$$(3.6) \quad \begin{aligned} S(X, W)S(Y, Z) - S(Y, W)S(X, Z) = \\ \mu [S(Y, W)g(Z, X) + S(Z, X)g(Y, W)] \\ + \beta [g(X, W)g(Y, Z) - g(Y, W)g(Z, X)], \end{aligned}$$

where μ, β are non-zero scalars, then the manifold is a mixed generalized quasi-Einstein manifold.

Proof. Let U be a vector field defined by

$$(3.7) \quad g(X, U) = T(X), \quad \forall X \in TM.$$

Putting $X = W = U$ in (3.6), we obtain

$$\begin{aligned} S(U, U)S(Y, Z) - S(Y, U)S(U, Z) = & \mu [S(Y, U)g(Z, U) + S(Z, U)g(Y, U)] \\ & + \beta [g(U, U)g(Y, Z) - g(Y, U)g(Z, U)]. \end{aligned}$$

Now using (2.5) and (3.7) in the above equation, we get

$$\begin{aligned} \bar{\alpha}S(Y, Z) - T(QY)T(QZ) &= \mu[T(QY)T(Z) + T(QZ)T(Y)] \\ &+ \rho[|U|^2g(Y, Z) - T(Y)T(Z)], \end{aligned}$$

where $S(U, U) = \bar{\alpha}$ and $T(QY) = g(QY, U) = S(Y, U)$. Therefore

$$\begin{aligned} S(Y, Z) &= \alpha T(QY)T(QZ) + \mu\alpha[T(QY)T(Z) + T(QZ)T(Y)] \\ &+ \rho\alpha[|U|^2g(Y, Z) - T(Y)T(Z)]. \end{aligned}$$

Taking $\alpha = \frac{1}{\bar{\alpha}}$ and $T(QY) = P(Y)$, we get

$$\begin{aligned} (3.8) \quad S(Y, Z) &= \alpha\rho[|U|^2g(Y, Z)] + (-\alpha\rho)T(Y)T(Z) + \alpha P(Y)P(Z) \\ &+ \alpha\mu[T(Y)P(Z) + P(Y)T(Z)]. \end{aligned}$$

Therefore in view of (3.8) we can conclude that the manifold is a mixed generalized quasi-Einstein manifold. $\square$

§ 4. Example of a mixed generalized quasi-Einstein manifold

A manifold of mixed generalized quasi-constant curvature defined by (1.2) is a mixed generalized quasi-Einstein manifold. Putting $X = W = e_i$ in (1.2), where $\{e_i\}$ is an orthonormal basis of the tangent space at each point of the manifold, and taking summation over i , $1 \leq i \leq n$, we obtain

$$\begin{aligned} S(Y, Z) &= [p(n-1) + q + s + 2t]g(Y, Z) + q(n-2)A(Y)A(Z) \\ &+ s(n-2)B(Y)B(Z) + t(n-2)[A(Y)B(Z) + B(Y)A(Z)]. \end{aligned}$$

Hence the manifold is a mixed generalized quasi-Einstein manifold.

§ 5. Hypersurfaces of the Euclidean space

Let M^n be a hypersurface of the Euclidean space E^{n+1} and the metric tensor $\tilde{g}$ of M^n is induced by E^{n+1} . The Gauss equation of M^n in E^{n+1} can be written as

$$(5.9) \quad \tilde{g}(\tilde{R}(X, Y)Z, W) = \tilde{g}(H(X, W), H(Y, Z)) - \tilde{g}(H(Y, W), H(X, Z)),$$

where $\tilde{R}$ is the Riemannian curvature tensor corresponding to the induced metric $\tilde{g}$, H is the second fundamental tensor of M^n (orthonormal to M^n) and X, Y, Z, W are vector fields tangent to M^n . If A_ξ is the (1,1) tensor corresponding to the normal valued second fundamental tensor H , then we have [2]

$$(5.10) \quad \tilde{g}(A_\xi(X), Y) = g(H(X, Y), \xi),$$

where ξ is the unit normal vector field and X, Y are tangent vector fields. Let H_ξ be the symmetric (0,2) tensor associated with A_ξ in the hypersurface defined by

$$(5.11) \quad \tilde{g}(A_\xi(X), Y) = H_\xi(X, Y).$$

A hypersurface of a Riemannian manifold (M^n, g) is called quasi-umbilical [2], if its second fundamental tensor has the form

$$(5.12) \quad H_\xi(X, Y) = \alpha \tilde{g}(X, Y) + \beta \omega(X) \omega(Y),$$

where ω is a 1-form. The vector field corresponding to the 1-form ω is a unit vector field, and α, β are scalars. If $\alpha = 0$ (resp. $\beta = 0$ or $\alpha = \beta = 0$) holds, then M^n is called cylindrical (respectively umbilical or geodesic).

In this section we define generalized quasi-umbilical hypersurface of a Riemannian manifold.

Definition 5.1. A hypersurface of a Riemannian manifold (M^n, g) is called generalized quasi-umbilical if its second fundamental tensor has the form

$$H_\xi(X, Y) = \alpha \tilde{g}(X, Y) + \beta \omega(X) \omega(Y) + \gamma \delta(X) \delta(Y),$$

where α, β, γ are scalars. The vector fields corresponding to 1-forms ω and δ are unit vector fields. If $\alpha = \beta = \gamma = 0$, M^n is called geodesic. If $\alpha = \gamma = 0$ or $\alpha = \beta = 0$, M^n is called cylindrical. Also M^n is called umbilical when $\beta = \gamma = 0$.

Now from (5.10), (5.11) and (5.12), we get

$$(5.13) \quad g(H(X, Y), \xi) = \alpha g(X, Y) g(\xi, \xi) + \beta \omega(X) \omega(Y) g(\xi, \xi).$$

Since ξ is the only unit normal vector, (5.13) reduces to

$$(5.14) \quad H(X, Y) = \alpha g(X, Y) \xi + \beta \omega(X) \omega(Y) \xi.$$

Let us suppose that the hypersurface is generalized quasi-umbilical. Then in view of (5.14) we have

$$(5.15) \quad H(X, Y) = \alpha g(X, Y) \xi + \beta \omega(X) \omega(Y) \xi + \gamma \delta(X) \delta(Y) \xi.$$

From (5.9) and (5.15) it follows that

$$(5.16) \quad \begin{aligned} \tilde{g}(\tilde{R}(X, Y)Z, W) = & \alpha^2 \{g(X, W)g(Y, Z) - g(Y, W)g(X, Z)\} \\ & + \alpha\beta \{g(X, W)\omega(Y)\omega(Z) + g(Y, Z)\omega(X)\omega(W) \\ & - g(Y, W)\omega(X)\omega(Z) - g(X, Z)\omega(Y)\omega(W)\} \\ & + \alpha\gamma \{g(X, W)\delta(Y)\delta(Z) + g(Y, Z)\delta(X)\delta(W) \\ & - g(Y, W)\delta(X)\delta(Z) - g(X, Z)\delta(Y)\delta(W)\} \\ & + \beta\gamma \{\omega(X)\omega(W)\delta(Y)\delta(Z) + \omega(Y)\omega(Z)\delta(X)\delta(W) \\ & - \omega(Y)\omega(W)\delta(X)\delta(Z) - \omega(X)\omega(Z)\delta(Y)\delta(W)\} \end{aligned}$$

On contraction to (5.16) we get

$$\begin{aligned} \bar{S}(Y, Z) = & [\alpha^2(n-2) + \alpha\beta + \alpha\gamma]g(Y, Z) + [(n-2)\alpha\beta + \beta\gamma]\omega(Y)\omega(Z) \\ & + [(n-2)\gamma\alpha + \beta\gamma]\delta(Y)\delta(Z) - \beta\gamma[\omega(Y)\delta(Z) + \delta(Y)\omega(Z)], \end{aligned}$$

which shows that the manifold is a mixed generalized quasi-Einstein manifold. Thus we can state the following theorem

Theorem 5.1. *A generalized quasi-umbilical hypersurface of a Euclidean space is a mixed generalized quasi-Einstein manifold.*

§ 6. Relations between structures.

Since $MG(QE)_n$ is quasi-conformally flat, from (2.3) we have

$$(6.17) \quad \begin{aligned} R(X, Y, Z, W) = & \frac{r}{na} \left[\frac{a'}{n-1} + 2b \right] [g(Y, Z)g(X, W) - g(X, Z)g(Y, W)] \\ & - \frac{b'}{a} [S(Y, Z)g(X, W) - S(X, Z)g(Y, W)] \\ & + g(Y, Z)S(X, W) - g(X, Z)S(Y, W). \end{aligned}$$

Using (1.1) in (6.17) we get

$$(6.18) \quad \begin{aligned} R(X, Y, Z, W) = & \left[\frac{r}{na} \left\{ \frac{a'}{n-1} + 2b \right\} - \frac{2ab'}{a} \right] [g(Y, Z)g(X, W) - g(X, Z)g(Y, W)] \\ & - \frac{bb'}{a} [g(X, W)A(Y)A(Z) - g(Y, W)A(X)A(Z) \\ & + g(Y, Z)A(X)A(W) - g(X, Z)A(Y)A(W)] \\ & - \frac{bc}{a} [g(X, W)B(Y)B(Z) - g(Y, W)B(X)B(Z) \\ & + g(Y, Z)B(X)B(W) - g(X, Z)B(Y)B(W)] \\ & - \frac{bd}{a} [\{A(Y)B(Z) + B(Y)A(Z)\}g(X, W) \\ & - \{A(X)B(Z) + B(X)A(Z)\}g(Y, W) \\ & + \{A(X)B(W) + B(X)A(W)\}g(Y, Z) \\ & - \{A(Y)B(W) + B(Y)A(W)\}g(X, Z)]. \end{aligned}$$

From (6.18) we can state the following

Theorem 6.1. *A quasi conformally flat mixed generalized quasi-Einstein manifold is a manifold of mixed generalized quasi-constant curvature.*

From (2.4) and Theorem 6.1 we can also have the following

Corollary 6.1. *A conharmonically flat mixed generalized quasi-Einstein manifold is a manifold of mixed generalized quasi-constant curvature.*
